

The BIG 4 Plastic Polluters

3. Straws

What happens when you have finished with your straw?

It could go to landfill or be incinerated.

It could cause injury to wildlife if it gets into the environment.

If it is not disposed of properly, it could make its way into a river, waterway and eventually into the ocean.

It could end up as litter on our streets.

An animal may mistake it for food and eat it. Plastic straws cannot be digested, so if an animal does eat one it could become very ill.

No straw please!
